

NeuroVista Corporation Receives Gold Electrode Award for “Most Promising Start-up Company”

Seattle, WA—November 20, 2007—NeuroVista Corporation received the Gold Electrode Award for “Most Promising Start-up Company” at the 2007 Neurotech Leaders Forum. The presentation took place on October 26, 2007 during a luncheon ceremony at the Radisson Hotel Newport Beach, CA. NeuroVista is an early-stage medical device company pioneering new technologies that will revolutionize the management and treatment of epilepsy. The company is led by an experienced management team in close collaboration with key clinical thought-leaders and investigators.

“We’ve built an outstanding team and are executing to our strategic plan,” said John F. Harris, President and Chief Executive of NeuroVista. “We believe that our technology has the potential to significantly impact the quality of life for people living with epilepsy and dramatically alter treatment paradigms.”

Unlike other neurological conditions such as stroke or Alzheimer’s disease that tend to affect people late in life, epilepsy often affects people throughout the prime of their life, with the majority between the ages of 15 and 64.

“Although NeuroVista has maintained a relatively low public profile, Neurotech Reports editors were sufficiently impressed with the company’s management team, investor base and intellectual property,” said James Cavuoto, editor and publisher of Neurotech Reports. “These are all key factors as this firm continues to develop implantable neuromodulation devices for treating epilepsy and other neurological disorders.”

About NeuroVista

NeuroVista is a Seattle based medical device company pioneering new technologies for the management and treatment of epilepsy, a condition that affects approximately 1% of the population or roughly 2.5 million individuals in the United States. The company seeks to not only improve the quality of life for people with this debilitating condition, but also to become a leading innovator in the rapidly growing field of implantable neurotechnology.
